Tevron Announces New Blog as part of their Customer Stories and ROI from the IT / Application Performance Trenches Blog Series

*Topic: Image recognition as the basis for p*erformance & load testing for RDS environments

Nashua, NH. USA – September 5, 2014 – Tevron, the leader in IT performance and end to end monitoring & testing solutions, today announced a new blog – part of their *Customer Stories and ROI from the QA/Application Performance Trenches* series – focused on performance and load testing for RDS environments.

Software test automation tools built to see Windows objects that require specialized knowledge to understand and manipulate will not work with Citrix and Microsoft Terminal Services, leaving you in the dark, and leading to underperforming applications and unsatisfied customers.

"Organizations that leverage RDS technology are unable to load test their applications using traditional object-based test automation tools – since no underlying objects or controls are delivered to the client, instead an image of the application is delivered to the client UI. For example, one of our customers, Fiserv (Fiserv.com), had a multi-tier Microsoft Silverlight-based architecture, where they were streaming their applications to many Remote Desktop Windows servers from a common dashboard, and they couldn't test until CitraTest VU came along." The first time they ran a CitraTest VU load test, they were extremely surprised with the results; they found a major memory hog and the application crashed with only half of the load originally planned for the test. Had this problem continued undetected, our client would have severely damaged their revenue and brand since this was an external-facing revenue-generating application – **Jay Labadini, VP of Tevron.**

Moreover, Agile development methodologies have drastically increased the velocity of release cycles, leaving little time to test. Therefore, it's imperative to automate performance testing to keep up with rapid development cycles. IT professionals looking to boost application quality within MTS, Citrix or RDS environments are encouraged to look for a performance and load testing solution designed to rely on advanced intelligent image recognition capabilities – automatically built into every test script – to replicate, test and measure any real world transaction using the actual client interface. And this is exactly what CitraTest VU delivers.
